

Section Overview

Geometric Relationships

Lesson 8-2

Why? Lines and planes are the building blocks of geometry.

Definition	Examples
Parallel lines lie in the same plane and do not intersect.	$\overline{CG} \parallel \overline{BF}$
Perpendicular lines intersect at right angles.	$\overline{BC} \perp \overline{BF}$
Skew lines lie in different planes, are not parallel, and do not intersect.	\overline{FG} and \overline{AE} are skew.
Parallel planes do not intersect.	plane $BCG \parallel$ plane ADH
Perpendicular planes are planes that intersect to form right angles.	plane $BCG \perp$ plane CDH

Triangles and Coordinate Geometry

Lessons 8-4, 8-5

Why? Polygons are all around us.

Triangles

Special Quadrilaterals

The interior angle measures of a triangle add to 180° .

Any two vertical lines are parallel. Vertical and horizontal lines are perpendicular. These are exceptions for the more general definitions below.

Parallel Lines
equal slopes

Perpendicular Lines
product of slopes = -1
